Appendix – III : Sample Census Questionnaire.....

Foreword

The fifth Population and Housing Census was conducted over a period of five days starting at the zero hour of 15 March 2011 and completing on the 19 March 2011. Population census done in every ten years indeed is the only recognized source in Bangladesh for quality benchmark database pertaining to population size and its spatial distribution and for various basic demographic characteristics. Along with national level aggregates, the census has generated detailed segregated data at community levels (mahallas/mauzas/villages) of the country being a full-count statistical undertaking. The initiative of publishing zila, community and national reports has been undertaken considering the importance of community level data and information apart from national level in the process of determining policy-strategy and decision-making. The **Socio-economic and Demographic Report** is an effort of the national reports publication to supplement the main census.

In this report, the sample survey results for national, zila and six city corporations' levels have been presented. I believe that the wide array of sample survey findings presented in this report will be useful to planners and policy makers in formulating, implementing and evaluating responsive development plans and programmes for human resource advancement and overall development as stipulated in the Vision 2021. In addition, the sample survey data and information of this report will be helpful for researchers both at home and abroad.

I am pleased to learn that Bangladesh is one of the pioneers in the development world which successfully applied ICR (Intelligent Character Recognition) and iCADE (Integrated Computer Assisted Data Entry) technologies in capturing and processing a large volume of census and survey data in a short span of time. It is indeed a commendable endeavour in census operation. Census is a massive operation which can not be performed by the national statistical organization alone. Its success depends on the joint efforts of the government and the people at large. I express my heart-felt gratitude to all citizens of Bangladesh for providing whole-hearted support and cooperation in census operation and the government and non-government personnel for making significant contribution to this operation. I am especially thankful to the members of Mass Media, Field Administration, Local Government Institutions at all levels and the public representatives who actively participated and motivated the public to provide accurate and reliable information during the census. Their contribution and all-out support towards making the census a success will always be highly appreciated.

Under the publication plan, 135 reports of the main census had been planned to publish including Community Reports (64 reports), Zila Reports (64 reports), National Series-Analytical Report (Volume-1), Union Statistics (Volume-2), Urban Area Report (Volume-3), Administrative Report (Volume-5), Post Enumeration Check (PEC) Report, Preliminary Report and Socio-economic and Demographic Report (Volume-4). Among them Community Reports, PEC Report and Preliminary Report have already been published. The present report is the comprehensive sample survey report covering wide spectrum of demographic and socio-economic scenarios.

It is my firm belief that the report will not only be useful for planners, policy makers, researchers, population scientists and administrators but also for development partners and BBS itself for undertaking future activities.

I express my gratitude to the United Nations Population Fund (UNFPA), European Union (EU), U.S. Census Bureau (USCB) and United States Agency for International Development (USAID) for their financial and technical supports for completing this huge task. I am grateful to the Cabinet Secretary and the Secretary, Ministry of Public Administration for their active cooperation and continuous encouragement and support. I express my gratitude to the Honourable Minister, Ministry of Planning for his leadership, guidance and active cooperation in making this census a real success.

I also extend my thanks to the Director General of Bangladesh Bureau of Statistics Mr. Golam Mostafa Kamal, Project Director Mr. Ashim Kumar Dey and all relevant Officials and Staff who have been firmly committed and dedicated to ensure the consistency of the survey in general and publish the Socio-economic and Demographic Report of the National Series in particular. Last but not least, I would also like to put on records the sincere efforts made by the members of

the Editorial Board led by my esteemed predecessor Ms. Riti Ibrahim in upholding the quality of the report.

Republic of Bangladesh

Preface

Bangladesh inherited the tradition of conducting the population census on decennial basis since 1872. The fifth Population and Housing Census of Bangladesh and fifteenth in the region, sequencing the decennial periodicity, was conducted during March 15-19, 2011. The main objective of the census was to collect information on the basic characteristics related to housing, households and population for developing a comprehensive database for all development planning and human resource development programmes as well as economic management.

With the diversification of research and development, scope and coverage in data needs have been increasing continuously. It is very difficult to meet all such data needs of various sectors through hundred percent count. During 1974 and earlier censuses data were collected on several items but a few of them were processed on hundred percent basis. From the experience it has been observed that addition of numerous questions inversely affect the quality of information. Thus following the international practice of trade-off, Bangladesh continued to collect data on basic characteristics through census and detailed socio-economic information through sample survey. For international comparison, Bangladesh census also followed concepts and recommendations of Global Rounds of population census. Under the conceptual framework of the United Nations, Bangladesh Bureau of Statistics had conducted the fifth Population and Housing Census of Bangladesh in 2011 in three phases as follows:

- In phase I, basic data about all households and individual members of the households were gathered through using ICR formatted questionnaire during March 15-19, 2011.
- In phase II, quality and coverage of the main count were verified through a Post Enumeration Check (PEC) survey during April 10-14, 2011. For the first time in census history of Bangladesh, the PEC was conducted by an independent organization, Bangladesh Institute of Development Studies (BIDS).
- In phase III, detailed socio-economic information was collected by adopting a long machine readable questionnaire in a sample survey to supplement the main census held during October 15-25, 2011.

Bangladesh Bureau of Statistics (BBS) had started the census preparatory activity from the beginning of 2009 with the updating of maps and area Geo-codes. A draft sample design was prepared by the Project Director to get cost effective and reliable estimates at the national, zila and city corporation levels. It was presented in a seminar-cum- expert consultation for open discussion and for obtaining recommendations. The recommendations were first examined by the Census Standing Technical Committee. The Census Standing Technical Committee had formed a sub-committee to design the sample and the questionnaire and to firm up the operational aspects of sample survey and to initiate and monitor the progress in detail. A sub-committee on sample survey and a supporting technical committee on sample design were also formed to check and modify the technical aspects of the sample design. The sample design was a stratified-two-stage cluster design which was a realistic one. Accordingly, the questionnaire was designed in a machine readable format with the technical assistance from US Census Bureau and was printed abroad with the financial assistance from European Union (EU) through the United Nations Population Fund (UNFPA).

In the main census there were 293,579 Enumeration Areas (EAs). On an average, an EA was comprised of 120 households. The sample survey covered 6,720 Enumeration Areas (EAs) which were selected as Primary Sampling Units (PSUs). For operational convenience a total of 25 households were selected from each PSU as Secondary Sampling Units (SSUs). In all, 2.29% of EAs and 0.52% of households were covered in the sample survey.

De jure Method was adopted in counting the population of Sample Survey, 2011. Following the method regular members of the households were counted whether they were present in the household at the time of enumeration or not. Zero hour of the night of following 14

October, 2011 was considered as the sample survey moment and the period from survey moment to 6.00 am was considered as sample survey night. Enumeration period was 10 days starting from 15 October 2011.

For operational convenience all the available Officers and Staff Members of BBS were mobilized as follows:

<u>Functional Designation</u>	<u>Designation</u>	<u>Number</u>
Chief Census Coordinator	Secretary, Statistics and Informatics Division (SID)	1
National Census Coordinator	Director General, Bangladesh Bureau of Statistics (BBS)	1
Deputy National Census Coordinator	Joint Secretary, SID & Deputy Director General, BBS	2
Census Zila Coordinator	Director/Deputy Secretary/Joint Director/Deputy Director/Statistical Officer	70
Upazila Census Coordinator	Upazila Statistical Officer/Assistant Statistical Officer	483
Supervisor	USO/ASO/TS/SI/SA/JSA	840

For actual enumeration 3,360 enumerators were employed from among the **local educated unemployed females**.

A verbatim training manual was prepared and used for imparting uniform training to all the sample survey workers. Training was given at two levels:

- (i) Training of Master Trainers (Census Zila Coordinators) at Dhaka and
- (ii) Training of Supervisors and Enumerators at the zila level.

A calendar of Sample Survey activities was developed and was adhered to strictly in providing training, distribution of survey materials, doing actual enumeration and returning all filled-in questionnaires to the Dhaka Headquarters. A centralized processing system was developed constituting the survey analysis and report writing team. Under the system, computer editing, data capture through ICR/iCADE and tabulation through CPro software were systematically linked.

Censuses are now-a-days a global event. In that respect, Bangladesh Population and Housing Census truly belongs to the world family of Population and Housing Censuses. For the first time ever, the key findings of the sample survey will be published in the Analytical Report (Volume-1) of the main census. In line with our principled stand to ensure consistency, the detailed information of sample survey were checked and verified with the results of main census at the lowest geographic area level, where it was necessary. Direct measures of fertility, mortality, housing and population characteristics were compared with the indirect measures obtained from both the census and the sample survey. To supplement the main census the sample survey report is being published as National Report (Volume-4), which is known as Socio-economic and Demographic Report.

I express my deepest gratitude to Mr. Md. Nojibur Rahman, Secretary-in-Charge and Ms. Riti Ibrahim, Ex-Secretary, Statistics and Informatics Division (SID) for their wholehearted cooperation, guidance and support in formulating this report.

I express my deep gratitude to all Standing Technical Committee Members, Development Partners and also to all participants of the seminar-cum-expert consultations for their valuable contributions towards finalizing the questionnaire and the sample survey program.

I am thankful to all members of the Sampling and Report Writing Team for their valuable contribution. I am also thankful to our Local Government bodies, Field Administration and the people of all levels for their wholehearted support to the sample survey.

Finally, I thank the Project Director Mr. Ashim Kumar Dey and other Officials and Staff Members of Statistics and Informatics Division (SID) and Bangladesh Bureau of Statistics

(BBS) for their untiring efforts in making the sample survey a success within a very short period of time and in publication of this report.

Map of Bangladesh

CHAPTER - 1

INTRODUCTORY NOTES AND DEFINITIONS

1.1 Background

The fifth as well as the last Population and Housing Census in Bangladesh was conducted during March 15-19, 2011 and the Sample Census, i.e., Socio-Economic and Demographic Survey was conducted during October 15-25, 2011. Generally the Sample Survey is always conducted with a short gap of the census conduct with a view to supplementing the data support to the census as because of the census information and data on population are collected with a short questionnaire where population and other fundamental questions are kept priority basis on the national issues for the government planning and policy formulation. In the subsequent survey, a long questionnaire is used to collect the subjective data on various purposes, especially to fill up the data gap on the current socio-economic condition and to perceive the demographic status of population in the country. Some other basic information on housing, health, sanitation, electricity, source of drinking water and any other particular issue that comes up and needs to the state policy formulation are also put in the questionnaire.

1.2 Concepts and Definitions

As this survey is a supplement to the main census, almost the definitions of technical and statistical terms of the census have been used and defined as usual in this report. In spite of that there are some other points apart from the definitions those need to be transparent. There may be difference between the survey estimates and census results. With a view to making comparison among variables and to define the relations and fluctuations, both the census results and survey estimates are put forth together in tables for better analysis in many occasions. But data references for both the findings are not equally comparable due to inner data-weights and from the methodological point of view. The census is a direct data provider. On the other hand, survey provides blown up estimates from the sample frame collected within a very narrow structure compared to the whole population. The second thing is the sample census and sample survey. Basically there is no fundamental difference between the terms from the point of methodological point of view. The sample census is conducted immediately after the census conduct following the sampling methods and the blown up estimates are provided. The sample survey may be conducted at any convenient time depending on the whole population (here, households) of the census structure and estimates are supplied from the blown up survey data.

1.3 Objectives of Survey

Household based Sample Survey is a basic and suitable method of data collection for population and socio-economic and demographic statistics. Therefore, the socio-economic and demographic survey has always been conducted near by a convenient time of the census completion. In many occasions, the survey is complementary to the census and provides supplementary data for the census to fill up the data gap, especially on the housing, health and demography those relate to population. It has some definite objectives which are described below:

- collecting information on household and housing status;
- providing data on household structural composition, relationship, size and the headship;
- obtaining data on age pattern, sex and demographic characteristics by gender issues;
- collecting information on public utilities such as water supply and sanitation, electricity connection etc. and
- generating data on household income, occupation and other socio-economic activities involved to household.

1.4 Questionnaire and Reference Period

A four pages long sample survey questionnaire in module form was designed and a total of 81 questions on 10 separate modules matters were incorporated. The sample survey was conducted during October 15-25, 2011. The BBS employees were the supervisors and the hired females were the interviewers. Data was collected carefully from the heads of households or reliable respondents of the households. A total of 25 sample households per enumeration area were covered within 10 days by 3360 female interviewers deployed all over the country and they all were supervised by 840 BBS employees with a proper chain of command under the guidance of the Director General of BBS. The 10 (ten) separate modules of the sample questionnaire are given below:

Modules	
1)	Identification and Household Summary
2)	Housing Related
3)	Household Related
4)	Individual
5)	Economic Activities
6)	Nuptiality
7)	Fertility
8)	Members Returned from Abroad
9)	International Migration
10)	Death

1.5 Statistical/Technical Terms and Definitions

Mostly the definitions and terms used in the survey are adopted intact from the census and without any change to facilitate the tools of comparison among similar variables. It offers the opportunity to study the changes/fluctuations of variables intensively. In addition some other clarifications relate to the subject are given where necessary. However, the terms and definitions used in the survey are defined by turns.

Household: A group of persons, related or unrelated, living together and taking food from the same kitchen.

Slum Household: Slum household is a dwelling household in the slum area. The housing structure of which is made of with the least cost materials and is built very temporary basis. The uprooted and floating poor, labourers, peddlers (hawkers) are the members of slum households. Slums are seen mainly in the towns/cities beside the main roads/highways or near by mills/factories/small scale industries, railway stations/junctions, or beside the railway line, near the market places, etc. or even on the government abandoned land/properties.

Enumeration Area: An enumeration area means a well defined and specified area of enumeration assigned to an enumerator. A map of this area is prepared showing boundaries and locations. An enumeration area may consist of taking several households. A mauza can be divided into several enumeration areas. In the sample survey 2011 an enumeration area was comprised of taking 25 households.

Establishment: The basic unit of economic activity is called establishment. It is usually a combination of both activities and resources under a single ownership and location.

Literacy: Person who is able to write a simple letter is defined as literate.

Educational Attainment: Educational attainment is defined as the highest grade completed within the most advanced level attended in the educational system of the country where the education is received. It is not the number of years spent at school which is counted but the highest grade or level completed in the regular school system. The term "completed" means the successful completion of a given grade or level of education of schooling years.

School Enrolment: The school enrolment is a ratio of total pupils (students) registered or enrolled to the school age population expressed in percentage.

Attendance Ratio: Attendance ratio is the ratio of pupils actually in attendance to pupils enrolled expressed in percentage.

Sex Ratio: The ratio of males to females in a given population usually expressed as the number of males per 100 females.

Growth Rate: The growth rate is the ratio of annual change to a number compared to the past expressed in percentage. This rate of change may be positive or negative in sense. In this report the growth is calculated using the following annual compounding formula:

$$P_n = P_0 (1 + r)^t$$

Where,

P_n = Current population,

P_0 = Previous population,

r = Annual population growth rate,

t = Time period between the preceding and the subsequent.

Economic Participation: Economic participation means the participation of population in the economic activities. Basically it indicates the economically active population or labour force which is comprised of all persons of either sex who furnish the supply of labour for the production of economic goods and services during the time-reference period chosen to the investigation. It includes employed and unemployed population. Employed population currently may be at work or may not be at work for time-being. Unemployed population indicates persons capable of working and still looking for work. They all are included in the labour force. "Labour force" is a similar terminology used for economically active population. It also refers both category of active persons under the civilian labour force and those of armed force members. On the other hand, economically inactive population consists of all persons who are not in the labour force and do not contribute directly to production of economic goods and services. This group of persons is comprised of persons engaged in household work (home-makers), students, income recipients, and other persons who are invalid due to physical disability and handicap, children and old-age retired persons incapable of working. Thus, a country's total population is divided into two major groups: (i) Economically active population and (ii) Economically inactive population.

Working Population: Working population indicates persons currently at work and looking for work and excludes persons not at work. Working population means the population those who are at work during the survey.

Crude Activity Rate: The crude activity rate is defined as the ratio of economically active population in the age group 10 years and over to the total population expressed in percentage. The crude activity rate and refined activity rate are jointly called activity rate.

Refined Activity Rate: The refined activity rate is the ratio of economically active population in the age group 10 years and over to total population of the same age group expressed in percentage.

Self Employed: A person/persons who operate/operates an enterprise or business on his/her own account or operate/operates in jointly with others in the form of partnership. A self-employed person may or may not hire workers to assist him/her in his/her enterprise.

Employer: An employer is a self-employed person who operates his or her own economic enterprise or engages independently in a profession or trade and hires one or more persons for his/her economic institution or in a dwelling house where he/she himself/herself participates actively.

Unpaid Family Helper/Worker: A person who works a specified minimum amount of time without pay in a family or in an operated farm or business owned or operated by the head of household or by any other member of the household to whom they are related by kinship, marriage, adoption or dependency.

Employee: A person who works for a public or private employer and receives remuneration in wages, salary, commission, tips, piece-rates or pay in kind.

Unemployed: The unemployed consists of all persons who, during the reference period, are not at work but who are seeking work for pay or profit including the person who never worked before. Also the persons who, during the reference period, are not seeking work because of temporary illness. They have made arrangements to start a new job subsequent to the reference period or they were on temporary or indefinite lay-off without pay.

Household Work: Persons engaged in house-wifery activities or various types of housework or domestic type of work at home other than economic activities, such as cooking, washing, taking care of household members, children, etc. are considered as household work. Either male or female may engage himself/herself in household work.

Singulate Mean Age at Marriage (SMAM): SMAM is defined as an estimate of the mean number of years lived by cohort of women before their first marriage. This is an indices method of estimation the mean age at marriage.

Crude Divorce Rate: It is a relative number of divorces per 1000 population.

Median Age: Median age is the middle most age with half of the population lying above and the other half lying below the age.

Dependency Ratio: Dependency ratio has been defined as the ratio of sum of population aged 0-14 years and 60+ years to the population aged 15-59 years expressed as percentage.

Infant: Infant refers to a baby who has not yet reached in his/her first birth day and is shown age 0 or under 1 year.

Child- Woman Ratio (CWR): The ratio of children under five (0-4) years of old to women of ages 15-49 is often called the child-women ratio. This is commonly expressed per 1000 population.

Crude Birth Rate (CBR): The ratio of live births in a specified period (usually one calendar year) to the average population in that period (normally taken to be the mid year population). The value is conventionally expressed per 1000 population.

Age-Specific Fertility Rate (ASFR): Number of live births occurring to women of a particular age or age group normally expressed per 1000 women in the same age-group in a given year. It is usually calculated for 5 years age groups from 15-19 to 40-44 or 15-19 to 45-49.

Total Fertility Rate (TFR): The sum of the Age-Specific Fertility Rates (ASFR) over the whole range of reproductive ages for a particular period (usually a year). It can be interpreted as the number of children a woman would have during her lifetime if she were to experience the fertility rates of period at each age.

General Fertility Rate (GFR): The GFR is the ratio of total number of children born alive per woman to the total number of women of ages 15-49 expressed per 1000 population.

Net Reproduction Rate (NRR): The average number of daughters that would be born to a woman if she passed through her lifetime from birth conforms to the age specific fertility rates of a given year. This rate is similar to the Gross Reproduction Rate (GRR) and takes into account

that some women will die before completing their childbearing years. NRR means each generation of mothers having exactly enough daughters to replace itself in the population.

Crude Death Rate (CDR): The crude death rate (CDR) is the number of deaths per 1000 mid-year population in a given year.

Under 5 Mortality Rate: Under-five mortality rate is defined as the number of deaths among children in age 1-4 per 1000 mid-year population in the same age group.

Infant Mortality Rate (IMR): The number of deaths occurring during a given year among the live-born infants who have not reached their first birthday divided by the number of live births in the given year. It is usually expressed per 1000 live births.

Maternal Mortality Ratio (MMR): The maternal mortality ratio (MMR) is the ratio of the number of maternal deaths during a given time period per 100,000 live births during the same time-period. A maternal death refers to a female death from any cause related to or aggravated by pregnancy or its management (excluding accidental or incidental causes) during pregnancy and childbirth or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy.

Life Expectancy at Birth: Expectation of life is the average remaining lifetime or the average number of year of life remaining at the beginning of age. Expectation of life at birth (e^0) is the average number of years of life remaining at beginning, i.e. '0' year of age.

Natural Growth Rate (NGR): The natural growth rate is the difference between crude birth rate (CBR) and crude death rate (CDR) expressed in percentage.

Crude Marriage Rate (CMR): CMR is the ratio of marriages in a given year to the mid-year population of that year.

Migration: Migration is defined in this survey as the movement of persons who change their place of residence, except for marriage, for a period of six months or more. The time period for the migration due to marriage is not fixed.

Migration Rate (MR): The in or out migration rate is defined as the number of in or out migration per 1000 mid-year population of a particular area for a specified time interval.

1.6 Some Other Concepts and Terms Used in the Survey

In this survey report there are some other concepts and terms used in several sections of the technical analysis. Even in some common terms need to clarify as they are similar to other and are used to express the specific meaning. For example, "cohort" is a demographic common term which is used to explain the observations of some different demographic phenomena. It often yields the useful clues to estimate the magnitude of changes taking place in a cohort analysis and to infer social and economic implications of those changes occurring in a cohort over time. Thus, the concept of cohort plays an important role for analytical and other observations of the population. In the survey many other concepts/terms are used and these are defined in turn.

Main Occupation: Occupation refers to the kind of work done during the time-reference period established for data on economic characteristics by the person employed (or performed previously by the unemployed). The head of household or other household members may engage himself/herself in more than one activity to earn more for economic solvency or to support the insufficient principal income. In the sense the survey questionnaire is put forth to inquiry about the main occupation and other subsidiary occupations. Main occupation is defined as the job mainly done by the member in exchange of which he/she gets some benefits either in cash or in kind for livelihood.

Subsidiary Occupation: If a member is engaged in more than one occupation, the occupation other than the main occupation is considered as subsidiary occupation. It is also called the secondary source of income.

Type of Industry: Industry refers to the activity of the establishment in which an economically active person worked during the time-reference period established for data on economic characteristics or last worked, if employed. The survey covers all types of industries or establishments in which persons were engaged in producing or distributing goods and services during the reference period.

Death: Death is the permanent disappearance of a member from all evidences of life at any time after live birth has taken place. But death prior to the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy, the death is indicated by the fact that after such separation the foetal does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. Such foetal death is not considered in the survey as it is very difficult to identify.

Age at Death: Age in complete years at the time of death is defined as age at death. In case, age is less than one year, age is recorded in number of complete months and any death at age below 1 year is called neonatal death.

Duration of Marriage: Duration of marriage is the time during which marriage lasted or continued.

Live Birth: Live birth refers to the births occurred after pregnancy and shows signs of life such as crying, breathing etc.

Neo-natal Mortality Rate (NMR): The neo-natal mortality rate is defined as the number of deaths of infants under 1 month of age during a year per 1000 live births in that year.

Post-Neonatal Mortality Rate (PNMR): The post-neonatal mortality rate is defined as the number of infant deaths under 1 through 11 months of age during a year per 1000 births in that year.

Crude Separation Rate: Crude Separation Rate is a relative number of separations per 1000 population.

Antenatal Care: Proportion of women aged 15-49 years that were attended at least once during pregnancy by skilled health personnel.

Internal Migration: Migration that takes place between the regions within the country.

Enrollment Rates: Percentage of children 6-10 years of age enrolled in primary schools. The figures represent net enrollment rates. The age is assessed using an events calendar. Children following the Primary School or Madrasa text book board are considered.

Ownership: This refers to the ownership of the unit and not the ownership of the building or structure in which it may operate. Ownership may be government, semi government, private, foreign or co-operative. In case of mixed ownership, enumerators are instructed to record the major ownership type.

Labor Force/Economically Active: Economically active population or labor force is defined as persons aged 15 years and above who are either employed or unemployed during the reference period of the survey (preceding week of the day of survey enumeration).

It includes:

- Employers
- Own account works/self-employed persons/commissioned agents
- Employees & salaried employees and wage earners, paid family workers

- Unpaid family workers
- Members of products co-operatives
- Persons classifiable by status.

Hours Worked: Hours worked is the total number of hours worked during the reference period of the survey for a person holding more than one job. Hour worked is the total of hours worked for all jobs.

Economic Activity: Economic activity is synonymous with the definition of U.N. System of National Accounts (SNA-2008) and covers all market production and certain types of non-market production including processing of primary products for own consumption, own account construction and production of fixed assets for own use. It excludes unpaid activities such as unpaid domestic activities and voluntary community services.

Unemployed Person: Unemployed person is a person who is involuntarily out of gainful employment during the reference period but either

- he/she is looking for a job or
- willing to work but not looking for work because of illness or believing that no work was available.

Employed Person: Employed person is a person who is either working one or more hours for pay or profit or working without pay on family farm or enterprise or organization during the reference period or found not working but has a job or business from which he/she is temporarily absent during the reference period.

Underemployment: Underemployment is the condition whereby a person's employment is considered inadequate in terms of time worked, income earned, productivity or use of his/her skills and the person is looking for additional work in conformity with his/her education or skill to augment income.

Index of Ageing: Index of ageing is the ratio of old persons of age 60 years and above to the young population of age 0-14 years expressed as percentage.

Non-economic Activity: It means the household activities that have no economic values like cooking, cleaning and washing, looking after the younger brothers/sisters and/or children etc.

1.7 Sample Design

To conduct the sample survey, 2011 a "stratified two-stage cluster sampling" was undertaken. It was a self weighted realistic design. People living in households were the target population.

1.8 Stratification

Two-way stratification had been made to isolate homogeneous groups. The first level stratification was done by locally and divided into the three strata:

- City Corporation Area;
- Urban Area and
- Rural Area.

1.9 Tabulation Plan

In order to meet the data requirements of the users an intensive tabulation plan was prepared with the help of US Census Bureau Team. As there were ten (10) modules in the questionnaire, separate tabulation plan on each module was considered.

1.10 Pre-test of the Questionnaire

The contents of Sample Survey questionnaire were determined based on data needs assessed on government current priorities and also recommendations of technical committee experts. Several preliminary checks of the questionnaire were made locally. Lastly, the questionnaire was pre-tested in selected areas with participation of some experts of the

technical committee. Satisfactory pre-test results were resolved finalising a ten moduled questionnaire for adoption in the survey. Accordingly the questionnaire was designed in machine readable format with the technical assistance from US Census Bureau and was printed abroad with the financial assistance from European Union (EU) through United Nations Population Fund (UNFPA).

1.11 Selection of Sample Units

A total of 6,720 sample EAs were selected following the predesigned allocation procedures depending on the frame of Population and Housing Census 2011. The covered area was entire Bangladesh. The sampling design was a two-stage cluster sampling with Enumeration Areas (EAs) being the first stage sampling units and households being the second stage units for each of the strata.

1.12 Field Organisation

For smooth conduct of the sample survey, the whole country was divided into 23 regions, 64 Zilas and 840 supervisors' areas to enumerate 6720 sample EAs. Secretary, Statistics and Informatics Division was the Chief Census Co-ordinator, the Director General of BBS was the National Co-ordinator and the Deputy Director General of BBS and the Joint Secretary, Statistics and Informatics Division were the Deputy National Co-ordinators. The Zilas were under the control of Census Zila Co-ordinators (CDCs). CDCs were the Officials of BBS. Most of the CDCs were sent from the headquarters except 23 CDCs who were Officers in charge of 23 Regional Statistical Offices of BBS. In the City Corporation Areas, additional CDCs were deployed according to the number of EAs and responsibilities. In the sample survey, CDCs were responsible for imparting training, distribution of materials to the field staffs and receiving back the filled-in and submitting those to the head office and to meet other problems in the field. Among 840 supervisors, 483 worked as upazila Census Co-ordinators (UCCs) cum supervisors who were Upazila Statistical Officers/Assistant Statistical Officers of BBS. All the 3360 enumerators were appointed from unemployed educated local females who did well as the enumerator in the Population and Housing Census 2011 conducted in 15-19, March 2011. In the selection process, preferences were given to unemployed females and almost all the enumerators were females. The enumerators were given honoraria and training allowances.

1.13 Training

A verbatim training manual was prepared for uniform training at all stages. There were two stages of training. In the first stage, all Census Zila Co-ordinators (CDCs) were trained at the headquarters who acted as master trainer for the second stage. A 3-days training was imparted for the Census Zila Co-ordinators (CDCs) in Dhaka headquarters. In the second stage, CDCs imparted training to the supervisors and enumerators. A 5-day long training was imparted to the supervisors and enumerators. The training manuals were made available to the supervisors and enumerators before the training. In all the stages of training, class room training were followed by field trip and mock training.

1.14 Enumeration

Enumeration was done during 15-25 October, 2011. The reference night was the night following 14th October, 2011. The enumeration was done following the *De jure* Method.

1.15 Identification of Enumeration Area

The EA boundaries were shown to the enumerators with the help of mauza map and also with the list of sample households supplied to them. This was mainly done by the supervisors and UCCs.

1.16 Collection of Filled in Questionnaires

The filled in schedules and documents were collected by the Census Zila Coordinators with the help of supervisors and submitted to the control room at the headquarters.

1.17 Control Room

During the field operation (starting from field training to return of documents) control rooms were operated at the headquarters and also in all regional offices. These control rooms were

kept open from 8.00 A.M. to 9.00 P.M. even on holidays. All the regional offices were directly linked with telephone lines. Any problem that occurred in the field was reported to the headquarters and necessary steps were immediately taken to solve the problems.

1.18 Inventory of Documents

All the documents collected by the Census Zila Co-ordinators (CDCs) at field level were returned to the headquarters by them as per schedule. The filled-in questionnaires were stored systematically by Zila and by upazila.

1.19 Data Capturing/Processing

The adoption of Intelligence Character Recognition (ICR) strategy was planned for Sample Survey data capturing. As such, ICR machines were used. BBS had gathered experience in OMR and OCR techniques data capturing from earlier censuses and surveys of 1981, 1991 and 2001. The ICR technology was introduced at this Sample Survey in BBS. US Census Bureau supported BBS in using **CapturePro** and **iCADE** (Integrated Computer Assisted Data Entry) system for data capturing. For analyzing and tabulating Sample Survey data **CSPro** software was used. The tabulations were made on the basis of pre-determined tabulation plan. Tabulated data were analyzed and checked for any inconsistency before printing.

1.20 Editing

In order to process the Sample Survey data, editing of the modules were done in an efficient computer edit and imputation program. The errors and inconsistencies, if detected, were imputed by applying both 'hot-deck' and 'cold-deck' methods through CSPro software. For this purpose, written editing instructions, code list for occupation, 2-digit code using Bangladesh Standard Occupational Classification (BSOC) and activity code lists, 2-digit code using Bangladesh Standard Industrial Classification (BSIC) were prepared following international classifications.

Chapter – 2

Sample Design

2.1 Introduction

The United Nations describes Census as the total process of collecting, compiling and publishing demographic, economic and social data pertaining at a specified time or times to all persons in a country or delimited territory. Census is a mammoth activity for every country. It is essential as it is required to study and find out future policies for welfare of its population. Population Census is the primary source of basic national population data required for administrative purposes and for many aspects of economic and social research and planning. Countries with big population like Bangladesh, census becomes gigantic. As the demand for data on almost every aspect of the social and economic status of a country's population increases, the process becomes more and more exhaustive. Censuses are usually sought to get comparable information in a fixed sequence on social and living conditions of people of various region, religion, community, gender, age, educational status etc. Data on many issues like sex ratio, education level and income, fertility rate, mortality rate, ratio of working women and men, number of disabled persons etc. are found to be of primary interest of various government and non-government sectors. However, incorporating too many dimensions in the census could possibly make the endeavor too complicated, expensive and time consuming as well. That is why almost every country in the world plans a survey with a detailed long questionnaire rightly after completing the census. This survey is often termed as Sample Census.

The fifth Population and Housing Census of Bangladesh began from midnight of 14 March, 2011 (Monday). The total number of people living in the country had been enumerated along with collection of concrete data on their age, sex, ethnicity, religion and social and economic status. As usual the census is planned to be followed by a long questionnaire survey. The long questionnaire survey is required to be technically very sound so that it can be advantageously utilized to upgrade and enhance the census data by appropriate supplementation, synchronization and matching. The sampling methodology for this planned survey is described in this document.

2.2 Sampling Design

The sampling design in this case is taken as a stratified two-stage cluster sampling method where at the first stage EAs (Enumeration Area having about 120 households each were created all over the country and GIS Map were developed for each EA prior to the census) are selected within the selected EA. Households listed in the Population and Housing Census 2011 are selected at the second stage.

2.3 Stratification

Since estimation is required for the Zila delineation without segregating for rural, urban and metropolitan region, primarily, the whole country is divided into 64 strata each defined as the administrative Zilas. At the national and divisional level the estimation is required to be segregated for rural, urban and city corporation regions. The Zila sample will therefore be consisted of both rural and urban region. In addition, for estimation at the city corporation level, six additional strata are defined as the six city corporations. There will be six city corporations strata, 64 Zilas strata

making a total of 70 (6+64) strata in the population. Independent sampling is done within each stratum. This stratification will result in the list of strata given in the Table 2. The sampling design is basically a two-stage cluster sampling with EAs being the first stage sampling units and households being the second stage units for each of the strata.

2.4 Sample size

From general theory the minimum required sample size is determined by the usual sample size determination formula for estimating proportion, which is given by:

$$n = \frac{n_0}{1 + \frac{n_0}{N}} \times \text{deff} \dots\dots\dots (1)$$

$$\text{With } n_0 = \frac{p(1-p)z_{\frac{\alpha}{2}}^2}{d^2} \dots\dots\dots (2)$$

Where, p is an apriori proportion of the required characteristics in the population, $z_{\frac{\alpha}{2}}$,

the value of the standard normal variate allowing $100\alpha\%$ probability of bad samples, d , the allowable margin of error, N is the population size and deff is the design effect used for complex surveys using multi-stage cluster sampling.

Conventionally α can be taken as 0.05 and deff can be taken as 1.5 - 2.0 for most socio-economic surveys in Bangladesh. Theoretically, an apriori $p = 0.5$ gives the safest sample size since $p(1-p)$ takes the highest value for $p = 0.5$. A common choice for the value of the allowable margin of error is $d = 0.05$. This value does not seem to be realistic for scenario where the true value of p is outside the range $0.2 \leq p \leq 0.8$ when a smaller value for d or consideration of a relative error margin is recommended. The equation (1) is used to revise the sample size and equation (2) for the population size N . It is observed in the theory that for $N \geq 8000$, equation (2) is not much influenced or improved. That is why, equation (2) is straight forwardly used for large population sizes and there is no necessity for increasing the sample size for population becoming any larger. In this particular study under interest, the minimum number of household required in each stratum will be focused and since the number of household in each of the defined strata is fairly larger than 8000, no adjustment for population size will be suggested. The conventional choice of $\alpha = 0.05$ will be considered which would give $z_{\frac{\alpha}{2}} = 1.96$. For safer sample size

design effect will be chosen as deff = 2 .

The main concern for sample size determination of this sample census will be to make choices of the values of p and d because a diverse range of variables will be under study. Previous estimates of the proportions for these variables are seen to vary from $p = 0.003$ (for MMR) to $p = 0.97$ (for access to drinking water) and hence taking a nominal choice of $d = 0.05$ would not serve the cause. It will be needed to determine the sample size by keeping the rare variables in mind and also by choosing a moderately small value of d . To allow a maximum error of $\pm 25\%$ ($d = 0.0125$) in estimating a characteristic as rare as 5% ($p = 0.05$), the minimum required sample size can be obtained to be approximately 2335 Household per stratum. This sample size will allow a narrower margin of error for estimating characteristics which are more common in nature and also for estimation for larger delineations. Table 1 and Figure 1 can illustrate the amount of allowable margin of error achievable for different type of estimations.

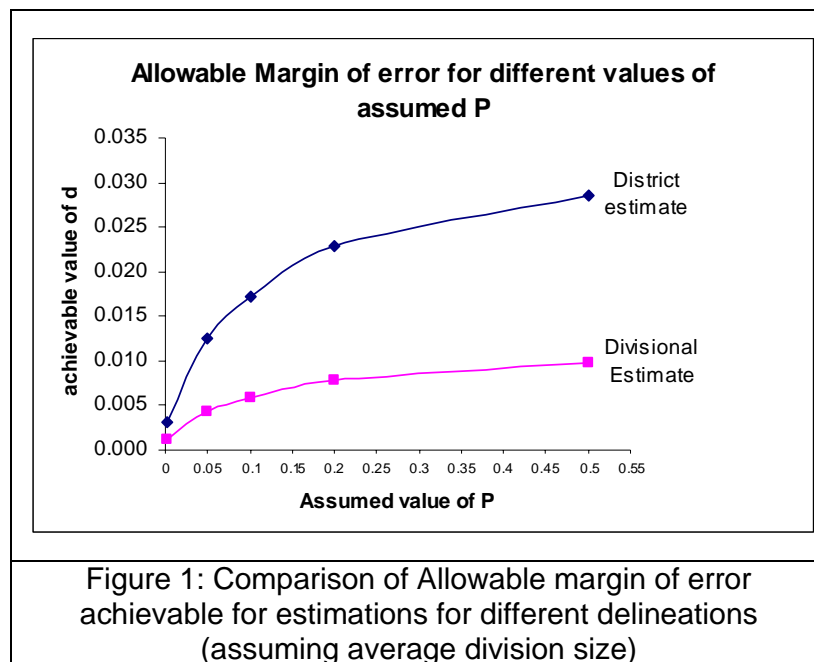

Table 1: Allowable Margin of Error Achievable for Different Type of Estimations for each Division

Items	Some Key Characteristics					
	Maternal Mortality Rate per HH per year	Access to Mass Media	Crude Birth Rate	Disability	Adult Literacy Rate	Population with access to improved water source

2.5 Allocation of Sample Size

Since individual stratum estimation is required and the sample size is determined to address the minimum requirement which need not be inflated for population size. There will be no need for using any proportional allocation. From each stratum minimum 2335 households are to be drawn. Looking at the number of household in individual EAs, we plan a second stage sample of 25 households from each selected EA. Approximately 96 EAs are to be selected from each stratum resulting a slight adjustment of the sample size to 2400 households per stratum. Table 3 produces the sample size allocation among strata.

Table 2: The Allocation of Sample Size among Strata

Sl. No.	Zila Code	Name of Zila	Rural		Urban		Total

2.6 Selection of Cluster (EA)

EAs do not vary much in size. So, these can be selected in a Zila with the help of simple systematic sampling without replacement. The list of EAs, obtained from the pre-census GIS mapping, is considered as the first stage sampling frame. The list of households of selected EA, obtained from the Population and Housing Census 2011, is considered as the 2nd stage sampling frame.

For selection of EAs, a random start and an interval is applied. Here the interval is the total number of EAs in the stratum divided by the number of EAs to be selected in that stratum. Random start is a random number between 1 and the calculated interval. Since Zila estimates (with segregation of rural/urban/metropolitan) will be obtained from this survey, this selection process is to be carried out independently for each stratum.

2.7 Estimating Formulae for Two Stage Cluster Sampling

Since the method of selection is the same for each stratum, the following estimating formulae will be applicable for each stratum:

Let y_{ij} be the measure of a variable Y , for j^{th} HH in i^{th} cluster or EA ($j=1, 2, \dots, N_{2i}; i=1, 2, \dots, n_1$). Let $Y = \sum_{i=1}^{N_1} \sum_{j=1}^{N_{2i}} y_{ij}$ be total of values of Y for all HHs in the whole strata, where N_1 is the number of EAs in the stratum and N_{2i} is the number of HH in the i^{th} EA.

2.8 Estimate of Population Total, Y

The estimated total is given by:

$$\hat{Y} = \sum_{i=1}^{n_1} \sum_{j=1}^{n_{2i}} w_i y_{ij} \dots \dots \dots (3)$$

Where $w_i = \frac{N_1}{n_1} \times \frac{N_{2i}}{n_{2i}}$ is the weight for the measurement of y_{ij} introduced due to two-stage cluster sampling, n_1 is the number of selected EAs in the stratum and n_{2i} is the number of HH in the i^{th} selected EA. Considering weighted measure $z_{ij} = w_i y_{ij}$, the estimator \hat{Y} in (3) can be re-written as:

$$\hat{Y} = \sum_{i=1}^{n_1} \sum_{j=1}^{n_{2i}} z_{ij} \dots \dots \dots (4)$$

This is an unbiased estimate of population total Y of variable Y . Since sampling fraction is small, the variance of \hat{Y} can be estimated by the replacement formula which is as follows:

$$V(\hat{Y}) = \frac{N_1^2}{n_1} \sum_{i=1}^{n_1} \frac{[\hat{y}_i - \hat{Y}]^2}{n_1 - 1} + \frac{N_1}{n_1} \sum_{j=1}^{n_{2i}} \frac{N_{2i}^2}{n_{2i}} \frac{[y_{ij} - \hat{y}_i]^2}{n_{2i} - 1} \dots \dots \dots (5)$$

with $\hat{y}_i = \sum_{j=1}^{n_{2i}} z_{ij}$.

Standard error of \hat{Y} is obtained from (5) as

$$SE(\hat{Y}) = \sqrt{V(\hat{Y})} \dots \dots \dots (6)$$

$2 \times SE(\hat{Y})$ is the error of the estimate, \hat{Y} , which means that population total, Y , is expected to lie within this error of the estimate in 95% cases.

2.9 Estimate of Population Mean, \bar{Y}

Let N be the number of households of the whole stratum, then the estimate of population mean, \bar{Y} and its standard error can be obtained by simply dividing the equation (4) and (6) by N , that is

$$\hat{\bar{Y}} = \frac{1}{N} \sum_{i=1}^{n_1} \sum_{j=1}^{n_{2i}} z_{ij}$$

$$\text{And } SE(\hat{\bar{Y}}) = \frac{1}{N} \sqrt{V(\hat{\bar{Y}})} .$$

2.10 Estimate of Population Proportion, P

Proportion is a special case of mean when the variable y is defined by:

$$y_{ij} = \begin{cases} 1 & \text{if the } (i, j)^{\text{th}} \text{ HH the characteristic under consideration} \\ 0 & \text{other wise} \end{cases}$$

With this definition of variable y , the estimating formulae in (3) can be applied for the estimation of proportion.

2.11 Estimates for Other Strata

The above formulae can be used independently for each stratum.

2.12 National Estimates

National estimates can be obtained from those of 136 strata.

2.13 Estimation of Total

For estimating national total of a variable, stratum totals of the variable and their estimated variances are added separately to get the national estimated total and its estimated variance respectively.

2.14 Estimation of Mean and Proportion

The estimated mean of a variable for whole country is the weighted mean of each stratum means. Let N_h and N be the number of households of h^{th} stratum and that of whole country respectively. Then the estimated mean of y for whole country is given by:

$$\bar{Y}_{st} = \sum_{h=1}^L \frac{N_h \hat{Y}_h}{N}$$

Where \hat{Y}_h = estimated mean for h^{th} stratum.

The estimated variance of \hat{Y}_{st} is

$$V(\hat{Y}_{st}) = \sum \frac{N_h^2}{N^2} V(\hat{Y}_h), \text{ where } V(\hat{Y}_h) \text{ is estimated variance of mean for } h^{\text{th}} \text{ stratum.}$$

These formulae can be used for estimating national proportion by replacing \hat{Y}_h by estimated proportion.
